

Attach the 4 solid walls (Sides and Backs) to the upper internal frame piece thingy.

Attach lower internal frame piece thingy.
Note : In photo above it's shown solid, the production piece has center cut out so you can install windows later if you like.

Identify the the 4 front walls with the window frames in them and lay them out in front of the model as shown.

Glue the 4 front wall pieces to the model

At this point in the build you have a decision to make, if you want to paint the window frames as show in the product video, now is the time to do that, If you want the window frames to be the same color as the rest of the model you can start gluing the other facade pieces on now.

If you are painting your window frames a different color, you can still use the tabs sticking out from the internal frame piece thingies to align the facade pieces and glue them to each other (but not to the building yet).

Lay out the roof pieces taking note of the angled edges and how they fit together.

Attach the roof pieces. It's helpful to have the facade pieces on the model at this point even if they are not glued on. Having them on helps you get the door pieces on straight and at the right level across the bottom of the pieces.

You are almost done. If you are painting the window frames a different color as explained on the product video, paint them now. then paint sides and back of the main building as well as the facade pieces with the building color of your choice. Then paint the roof pieces. Once everything is dry, attach the facade pieces and you are done.
